

Poultry Nutrition

Lecture 2

Feed ingredients for Poultry

* Components of feed are called feed ingredients or feed stuff.

* Concentrates are used because poultry do not have cellulase.

Concentrates

* DCP → Dicalcium Phosphate.

Energy

Cereal grain and grain by products
eg. maize, wheat, rice, sorghum, oat.
eg. wheat bran, rice polish, maize bran

→ Many minerals have very low bioavailability in cereal grains (AMF₃)
eg. Phytate (Phosphorus) → Phytate is given as P₂O₅ in wheat disturbs digestive system
↳ Wheat < 10%.

ANFs:

eg Sorghum $\rightarrow$ Tannins.

Cotton seed cake $\rightarrow$ Toxic.

Protein,

$\rightarrow$ Animal source.

$\rightarrow$ Plant source $\rightarrow$ oil seeds.

* Meal $\rightarrow$ oil extraction through solvent eg Hexane.

* Cake $\rightarrow$ oil extraction through mechanical means
eg soybean meal, ~~cotton~~ sunflower meal.
eg cotton seed cake

$\rightarrow$ Plant source protein are not as
balanced as animal protein source.

$\rightarrow$ But selected on the basis of
cost, palatability etc.

Animal sources

$\rightarrow$ Bone meal, fish meal.

$\rightarrow$ Affect palatability

Fats:

Added in less quantity.

Minerals:

Macro and micro mineral

$\rightarrow$ ~~Out~~ Minerals used in more than 0.01%
of poultry bodyweight are Macro

Vitamins:

Help in absorption and other body
functions.

* Maize is lysine deficient.

* Soybean is methionine deficient.
